                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ribelafontaine, P.; Lou, H.; Harrison, D.G.; Bernstein, K.E. dene 130, 305-306, 1993
A: Title: Sequence of a cDNA encoding dog insulin-like growth factor I.
A: Reference number: PN0622; MUID: 93366192
A: Accession: PN0622
A: Molecule type: mRNA
A: Residues: 1-122 < CDEL>
C: Comment: This protein is a potent inducer of DNA synthesis in multiple cell types, act
C;Comment: The insulin-like growth factors, isolated from plasma, are structurally and C;Comment: For an alternative splice form, see PIR:IGHUIB.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. /SIDS1/gcgdata/geneseq/geneseqp-emb1/AA1999.DAT:*/SIDS1/gcgdata/geneseq/geneseqp-emb1/AA1999.DAT:*/SIDS1/gcgdata/geneseq/geneseqp-emb1/AA1000.DAT:*/SIDS1/gcgdata/geneseq/geneseqp-emb1/AA2000.DAT:*/SIDS1/gcgdata/geneseq/geneseqp-emb1/AA2001.DAT:*

```
an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a medicament for the treatment of neurological disorder. The MGF is capable of reducting motoneurone loss by 20% or greater in response to nerve avulsion, and effects motoneurone rescue, preferably adult motoneurone rescue. The MGF polyncleotide and polypeptide are useful in the manufacture of a medicament for the treatment of a neurological disorder, including a disorder of motoneurones and/or neurodegenerative disorder, e.g., amyotrophic lateral sclerosis, spinal muscular atrophy, progressive spinal muscular atrophy, infantile or juvenile muscular atrophy, progressive poliomyellusis or post-polio syndrome, a disorder caused by exposure to a
                                                                                                                                                                                                                                                                                                                                                                                                                  toxin, motoneurone trauma, a motoneurone lesion or nerve damage, an injury that affects motoneurones, motoneurone loss associated with aging, autosomal or sex-linked muscular dystrophy, diabetic neuropathy, peripheral neuropathies, Alzheimer's disease and Parkinson's disease. The present sequence is rat IGF-I isoform MGF: MGF is a muscle isoform having extracellular (Ec) domain, hence also referred as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Rabbit; IGF-I isoform; Insulin-like Growth Factor-I; MGF; mechano-growth factor; neurological disorder; neurodegenerative disorder; amyotrophic lateral sclerosis; spinal muscular atrophy; muscular atrophy; poliomyelitis; post-pollo syndrome; toxin; motoneurone disorder; nerve damage; autosomal muscular dystrophy; diabetic neuropathy; sex-linked muscular dystrophy; peripheral neuropathy; Alzheimer's disease; Parkinson's disease.
                 Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of medicament for the treatment of neurological disorder -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     isoform having extracellular (Ec) domain, hence also referred as IGF-I-Ec. The MGF protein comprises amino acid sequences encoded by nucleic acid sequence of IGF-I exons 4, 5 and 6 in the reading frame
                                                                                                                                                         The present invention relates to use of mechano-growth factor (MGF),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 GPETLCGAELVDALQFVCGPRGFYFNKPTVYGSSIRRAPQTGIVDECCFRSCDLRRLEMY 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 GPETLCGAELVDALQFVCGPRGFYFNKPTVYGSSIRRAPQTGIVDECCFRSCDLRRLEMY 60

The present invention relates to use of mechano-growth factor (MGF),

an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a
medicament for the treatment of neurological disorder. The MGF is capable

CC reducing motoneurone loss by 20% or greater in response to nerve

cof reducing motoneurone loss by 20% or greater in response to nerve

cof reducing motoneurone loss by 20% or greater in response to nerve

covilision, and effects motoneurone rescue, preferably adult motoneurone

cc rescue. The MGF polynucleotide and polypeptide are useful in the

cc manufacture of a medicament for the treatment of a neurological disorder,

including a disorder of motoneurones and/or neurologenerative disorder,

cc including a disorder of motoneurone and/or neurologenerative disorder,

cc spinal muscular atrophy, infantile or juvenile muscular atrophy,

cc spinal muscular atrophy, infantile or juvenile muscular atrophy,

cc toxin, motoneurone trauma, a motoneurone lesion or nerve damage, an

cc injury that affects motoneurones, motoneurone lesion or nerve damage,

cautosomal or sex-linked muscular dystrophy, diabetic neuropathy,

cautosomal or sex-linked muscular dystrophy, diabetic neuropathy,

cautosomal or sex-linked muscular dystrophy, diabetic neuropathy,

cutosomal neuropathies, Alzheimer's disease and Parkinson's disease.

CC isoform having extracellular (EC) domain, hence also referred as

cc isoform having extracellular (EC) domain, hence sencoded by

cc isoform the motoneurone and sequences encoded by

cc isoform card sequence of IGF-I exons 4, 5 and 6 in the reading frame
                                                                                                                                Factor-I, capable of reducing motoneurone loss, in the manufacture of a medicament for the treatment of neurological disorder -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0; Gaps

                                                                                                                 A use of insulin like growth factor I (IGF-1) has been developed, and is characterised by the presence of the Ec peptide, or a functional equivalent, in the treatment or therapy of a human or animal. The IGF-1 polypeptide can be used to treat muscular disorders, e.g. Duchenne or Becker muscular dystrophies and related progressive skeleral muscle weakness and wasting, muscle atrophy in ageing humans, spinal cord injury induced muscle atrophy and neuromuscular diseases, and cardiac disorders, e.g. diseases where promotion of cardiac mescle protein synthesis is a beneficial treatment, cardiomyopathies and acute heart failure or insult, specifically myocarditis or myocardial infarction. It can also be used to promote bone fracture healing and maintenance of bone in old age. The present sequence represents rabbit IGF-1 used in the present specification.

The present invention relates to use of mechano-growth factor (MGF),

an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a
medicament for the treatment of neurological disorder. The MGF is capable

of reducing motoneurone loss by 20% or greater in response to nerve

avulsion, and effects motoneurone rescue, preferably adult motoneurone

contained an amedicament for the treatment of a neurological disorder,

including a disorder of motoneurones and/or neurodegenerative disorder,

including a disorder of motoneurones and/or neurodegenerative disorder,

e.g., amyotrophic lateral sclerosis, spinal muscular atrophy,

conjournyellitis or post-polic syndrome, a disorder caused by exposure to a

toxin, motoneurone trauma, a motoneurone lesion or nerve damage, an

conjournyellitis or post-polic syndrome, a disorder caused by exposure to a

toxin, motoneurone trauma, a motoneurone loss associated with aging,

cutosomal or sex-linked muscular dystrophy, diabetic neuropathy,

conform having extracellular (EC) domain, hence also referred as

The present invention relates to use of mechano-growth factor (MGF), an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a medicament for the treatment of neurological disorder. The MGF is capable of reducing motoneurone loss by 20% or greater in response to nerve avulsion, and effects motoneurone rescue, preferably adult motoneurone rescue, preferably adult motoneurone rescue. The MGF polynucleotide and polypeptide are useful in the manufacture of a medicament for the treatment of a neurological disorder, including a disorder of motoneurones and/or neurodegenerative disorder, e.g., amyotrophic lateral sclerosis, spinal muscular atrophy, progressive spinal muscular atrophy, infanile or juvenile muscular atrophy, solicy syndrome, a disorder caused by exposure to a toxin, motoneurone trauma, a motoneurone lesion or nerve damage, an injury that affects motoneurone, motoneurone loss associated with aging mutcomal or sex-linked muscular dystrophy, disease and barkingon, and autosomal contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Rat; IGF-I isoform; Insulin-like Growth Factor-I; MGF; mechano-growth factor; neurological disorder; neurodegenerative disorder; amyotrophic lateral sclerosis; spinal muscular atrophy; muscular atrophy; poliomyelitis; post-polio syndrome; toxin; motomeurone disorder; nerve damage; autosomal muscular dystrophy; diabetic neuropathy; sex-linked muscular dystrophy; peripheral neuropathy; Alzheimer's disease; Parkinson's disease; liver; L.IGF-I.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Note: The present sequence (SEQ ID NO: 12) is stated as being the same as that shown in figure 9 (AAE02531) of the specification. However
                                                                                                    Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of medicament for the treatment of neurological disorder -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   peripheral neuropathies, Alzheimer's disease and Parkinson's disease. The present sequence is rat liver type IGF-I isoform (L.IGF-I). The L.IGF-I protein comprises amino acid sequences encoded by nucleic acid sequence of IGF-I exons 4 and 6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 GPETLCGAELVDALQFVCGPRGFYFNKPTVYGSSIRRAPQTGIVDECCFRSCDLRRLEMY 60

The present invention relates to use of mechano-growth factor (MGF), an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a medicament for the treatment of neurological disorder. The MGF is capable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           including a disorder of motoneurones and/or neurodegenerative disorder, e.g., amyotrophic lateral sclerosis, spinal muscular atrophy, progressive spinal muscular atrophy, infantile or juvanile muscular atrophy, poliomyelitis or post-polio syndrome, a disorder caused by exposure to a toxin, motoneurone trauma, a motoneurone lesion or nerve damage, an injury that affects motoneurones, motoneurone loss associated with aging,
                                                                                                                                                                                                                                                                                                                                                                                                                  of reducing motoneurone loss by 20% or greater in response to nerve avulsion, and effects motoneurone rescue, preferably adult motoneurone rescue. The MGF polynucleotide and polypeptide are useful in the manufacture of a medicament for the treatment of a neurological disorder,
                                                                                                                                                                                                                                                    Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of a medicament for the treatment of neurological disorder -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        autosomal or sex-linked muscular dystrophy, diabetic neuropathy, peripheral neuropathies, Alzhehmer's disease and Parkinson's disease. The present sequence is alternative version of rat liver-type IGF-I isoform (L.IGF-I). The L.IGF-I protein comprises amino acid sequences encoded by nucleic acid sequence of IGF-I exons 4 and 6.

Note: The present sequence is stated as being the same as SEO ID NO: 12 shown in sequence listing (AAE02451) of the specification. However
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; IGF-I isoform; Insulin-like Growth Factor-I; MGF; mechano-growth factor; neurological disorder; neurodegenerative disorder; amyotrophic lateral sclerosis; spinal muscular atrophy; muscular atrophy; poliomyelitis; post-polio syndrome; toxin; motoneurone disorder;
                                                                                                                                                                                                                                                                                                     A 42 base oligonucleotide corresponding to the DNA sequence encoding amino acids 10 to 23 of mature human IGF-I was synthesized (AAN70437). The radiolabelad 42 mer was then employed to screen for IGF-I containing DNA sequences in a human liver CDNA library. Insulinlike growth factors-IA and "IB CDNAS were isolated from a human CDNA library by using lambdagt 11 (AAN70435, AAN70436). The human IGF-I genomic gene was isolated and mapped. It encodes at least two preproinsulin-like growth factor-I proteins. An essentially pure proproinsulin-like growth factor-I protein comprising the sequence of amino acids shown in Figure six is claimed (AAP70277).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      49 GPETLCGAELVDALQFVCGDRGFYFNKPTGYGSSSRRAPQTGIVDECCFRSCDLRRLEMY 108

The present invention relates to use of mechano-growth factor (MGF), an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a medicament for the treatment of neurological disorder. The MGF is capable of reducing motoneurone loss by 20% or greater in response to nerve avulsion, and effects motoneurone rescue, preferably adult motoneurone rescue. The MGF Polynucleotide and polypeptide are useful in the manufacture of a medicament for the treatment of a neurological disorder, including a disorder of motoneurones and/or neurodegenerative disorder, eg., amyotrophic lateral sclerosis, spinal muscular atrophy, progressive spinal muscular atrophy, infantile or invenile muscular atrophy, progressive poliomyelitis or post-polio syndrome, a disorder caused by exposure to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       toxin, motoneurone trumma, a motoneurone lesion or nerve damage, an injury that affects motoneurones, motoneurone loss associated with aging, autosomal or sax-linked muscular dystrophy, diabetic neuropathy, peripheral neuropathies, Alzheimer's disease and Parkinson's disease. The present sequence is human liver-type IGF-I isoform (L.IGF-I). The LIGF-I protein comprises amino acid sequences encoded by nucleic acid sequence of IGF-I exons 4 and 6.
                                                                                                                                                                                                                                                                                      Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of a medicament for the treatment of neurological disorder -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

```
animal comprises treating with an agent that modulates the activity of one or more of genes from zif266, insulin-like growth factor (IGF), glutamate receptor 1 (GluR1), glutamate receptor 2 (GluR2), c/EBPbeta and neuroendocrine VGF (neurotropin-inducible gene). The method is useful for conducting a drug and/or target discovery business, which comprises conducting and around and of the agents (or their analogues) identified for efficacy and toxicity in animals, and formulating a pharmaceutical preparation including one or more agents identified as having an acceptable therapeutic profile and/or licensing to a third party the rights for further drug development of the identified agents. The method of conducting drug discovery business further comprises an additional step of establishing a distribution system for distributing the preparation for sale and may optionally pharmaceutical composition containing the agent is useful for enhancing memory, consolidation in an animal, or for augmenting learning and memory,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   or otherwise for enhancing the functional performance of central nervous system neurons, where the agent is a CAMP elevating agent (agonist) preferably a CAMP analogue or CAMP phosphodisesterase inhibitor, which activates adenylate cyclase. The composition is useful for treating diseases associated with learning disabilities, memory impairment e.g. due to toxicant exposure, brain injury, epilepsy, mental retardation in children and senile dementia, including Alzheimer's disease. The present sequence represents human insulin-like growth factor, IGF1.
                                                                                                                                                                                                                                                                                          The invention relates to modulating long term memory consolidation in an

The amino acid sequence of the insulin-like growth factor 1 pre-protein. Processing of the protein results in a 70 amino acid mature protein. The mature protein is split into 4 domains: the B domain has strong homology to the B chain of insulin, the A domain similarly has homology to the A chain of insulin. These domains are separated by a C domain and the mature protein is terminated by a D domain at the C-terminus. The D domain sequence was used to synthesis peptides (AAR83801-2) that include amino acid residues 60-64 of the mature IGF-1 protein. IGF-1 binds to the IGF-1 receptor (IGF-IR) via the D domain and induces activation of the IGF-IR by autophosphorylation of the IGF-IR. Activated IGF-IR is associated with cellular growth and proliferation. If synthetic peptides are useful as inhibitors of IGF-I binding to IGF-IR and thus may be used in the treatment of disorders characterised by undesirable cell proliferation eg. cancer, restenosis, asthma, burns,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     49 GPETLCGAELVDALQFVCGDRGFYFNKPTGYGSSSRRAPQTGIVDECCFRSCDLRRLEMY 108

DNA can be used in the vector of the invention, for expression of a nucleic acid sequence in a cell, which comprises: (a) a nucleic acid cassette containing a sequence encoding IGF-I; (b) a 5' flanking region including one or more sequences necessary for expression of the nucleic acid cassette, including a promoter from a skeletal alpha-actin gene; (c) a linker connecting the 5' flanking region to a nucleic acid, the linker having a position for inserting the nucleic acid cassette, and lacking the coding sequence of a gene with which it is naturally associated; and (d) a 3' flanking region, including a 3' untranslated region or a 3' non coding region or both, where the 3' flanking region is 3' to the position for inserting the nucleic acid cassette and comprises a sequence from a growth hormone 3' urg. The vector can provide for efficient IGF-I expression, particularly in gene therapy. It can be used for the delivery of IGF-I for treating diseases such as muggle atrophy,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 diabetes, neuropathy, osteoporosis, and growth disorders. They can be used for treating peripheral neuropathies resulting from diabetes, genetic disease such as Type I or Type II diabetes, genetic disease such as Chacot-marie-tooth disease, AIDS, atherogenesis, atherosclerotic, cardiovascular, cerebrovascular, or peripheral vascular disease, haemophilia, inflammation and side-effects from anti-cancer and anti-viral drugs. The vectors can also be used to create transgenic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A method has been developed of treating urinary incontinence (UI) in mammals. The method comprises delivering a nucleic acid vector for the expression of a growth factor or neurotrophic factor in a tissue or tissues. The present sequence represents human IGF-1 (insulin-like growth factor 1) which is used in the method of the invention. Due to the growth and stimulatory effects of growth factors and neurotrophic factors, introducing these factors to degenerated muscles in the urinary system can improve UI by enhancing both their integrity and neural innervation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        49 GPETLCGAELVDALQFVCGDRGFYFNKPTGYGSSSRRAPQTGIVDECCFRSCDLRRLEMY 108

A use of insulin like growth factor I (IGF-1) has been developed, and is characterised by the presence of the Ec peptide, or a functional equivalent, in the treatment or therapy of a human or animal. The IGF-1 polypeptide can be used to treat muscular disorders, e.g. Duchenne or Becker muscular dystrophy, autosomal dystrophies and related progressive skeletal muscle weakness and wasting, muscle atrophy in ageing humans, spinal cord injury induced muscle atrophy and neuromuscular diseases, and cardiac disorders, e.g. diseases where promotion of cardiac muscle protein synthesis is a beneficial treatment, cardiomyopathies and acute heart failure or insult, specifically myocarditis or myocardial infarction. It can also be used to promote bone fracture healing and maintenance of bone in old age. The present sequence represents human IGF-1 Ea isoform used in the present specification.

The IGF-1 which is used for growth of bone and the therapy of tumours. The IGF-1 precursor is prepared by inserting the codding sequence into an expression vector, transforming a host cell with the expression vector. Culturing the transformed cell and retrieving the IGF-1 precursor from the culture supernatant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Use of insulin like growth factor I characterised by presence of Ecpeptide - to treat humans or animals, particularly muscle disorders, heart conditions or neuromuscular diseases

of reducing motoneurone loss by 20% or greater in response to nerve avulsion, and effects motoneurone rescue, preferably adult motoneurone cavulsion, and effects motoneurone rescue, preferably adult motoneurone rescue. The MGF polymorlectide and polypeptide are useful in the manufacture of a medicament for the treatment of a neurological disorder, including a disorder of motoneurones and/or neurodegenerative disorder, co.g., amyotrophic lateral sclerosis, spinal muscular atrophy, progressive spinal muscular atrophy, infantile or juvenile muscular atrophy, progressive co.g. poliomyelitis or post-polio syndrome, a disorder caused by exposure to a control or sex-linked muscular dystrophy, diabetic neuropathy, co.g. puripheral neuropathies. Alzhainer's disease and Parkinson's disease. Co.g. The present sequence is rabbit liver-type IGF-I isoform (L.IGF-I).

The L.IGF-I protein comprises amino acid sequences encoded by conclete acid sequence (SEQ ID NO: 14) is stated as being the same as that shown in figure 10 (AAE02456) of the specification. However it differs at few positions.

Patent No. 6017731
GENERAL INFORMATION:
APPLICANT: Tekamp-Olson, Patricia
TITLE OF INVENTION: METHOD FOR EXPRESSION OF HETEROLOGOUS
TITLE OF INVENTION: PROTEINS IN YEAST
NUMBER OF SEQUENCES: 41
CORRESPONDENCE ADDRESS:
ADDRESSEE: 8611 Seltzer IP Group of Alston & Bird, LLP
STREET: 3605 Glenwood Ave. Suite 310
                                                                                                                                                                                                                         ;Patent No. 5405942

Patent No. 5994109
GENERAL INFORMATION:
APPLICANT: Woo, Savio L.C.
APPLICANT: Smith, Louis C.
APPLICANT: Gristiano, Richard J.
APPLICANT: Gottchalk, Stephen
TITLE OF INVENTION: NUCLEIC ACID TRANSPORTER SYSTEMS AND
TITLE OF INVENTION: METHODS OF USE
NUMBER OF SEQUENCES: 65
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SOFTWARE: Patentin Release #1.0, Version #1.30 CURRENT APPLICATION DATA:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A. Cross-references: GB.X56774; GB.S61860; NID:932991; PIDN:CAA40093.1; PID:932992.
A. Experimental source: anaplastic oligodendroglioma
A. Note: sequence modified after extraction from NCBI backbone
A. Note: the authors translated the codon CAG for residues 124 and 133 as Glu
A. Note: sequence extracted from NCBI backbone (NCBIN:133058)
A. Stille: A mitogenic peptide amide encoded within the E peptide domain of the insulin A. Rochence innuber: AAZ664; MUDID:92390398
A. Stille: A mitogenic peptide amide encoded within the E peptide domain of the insulin A. Contents: annotation; IBB-1: amidated carboxyl end
C. Comment: For an alternative splice form, see PIR:IGHUI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A; Accession: A01611

A Molecule type: mRNA

C Comment: The insulin-like growth factors, isolated from plasma, are structurally and for comment: For an alternative splice form, see PIR:IGHUIB.

C C Genetics:

A Gene: GDB:IGF1

A Molecule type: mRN:147440

A Map position: 12q22-12q24.1

A Introns: 21/3; 74/1; 134/3

C Superfamily: insulin

C Keywords: alternative splicing; growth factor; plasma

           -:- FUNCTION: THE INSULIN-LIKE GROWTH FACTORS, ISOLATED FROM PLASMA,
ARE STRUCTURALLY AND FUNCTIONALLY RELATED TO INSULIN BUT HAVE A
MUCH HIGHER GROWTH-PROMOTING ACTIVITY.
-:- SUBCELLULAR LOCATION: Secreted.
-:- ATTERNATIVE PRODUCTS: 2 ISOFORMS; IGF-IA AND IGF-IB (SHOWN HERE);
ARE PRODUCED BY ALTERNATIVE SPLICING.
-:- SIMILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

-i- FUNCTION: THE INSULIN-LIKE GROWTH FACTORS, ISOLATED FROM PLASMA, ARE STRUCTURALLY AND FUNCTIONALLY RELATED TO INSULIN BUT HAVE A MUCH HIGHER GROWTH-PROMOTING ACTIVITY.

-!- SUBCELLULAR LOCATION: Secreted.
-!- ALTERNATIVE PRODUCTS: TWO FORMS OF IGF-1, IGF-IA AND IGF-IB ARE PRODUCED BY ALTERNATIVE SPLICING.
-!- SIMILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY. Sato A., Nishimura S., Ohkubo T., Kyogoku Y., Koyama S., Kobayashi Yasuda T., Kobayashi Y.;

Raschdorf F., Dahinden R., Maerki W., Richter W.J., Merryweather J.P.;
"Location of disulphide bonds in human insulin-like growth factors
(IGFS) synthesized by recombinant DNA technology.";
Biomed. Environ. Mass Spectrom. 16:3-8 (1988).

-!- FUNCTION: THE INSULIN-LIKE GROWTH FACTORS, ISOLATED FROM PLASMA,
ARE STRUCTURALLY AND FUNCTIONALLY RELATED TO INSULIN BUT HAVE A
MUCH HIGHER GROWTH-PROMOTING ACTIVITY.

-!- SUBCELLULAR LOCATION: Secreted.
-!- SUBCELLULAR PRODUCTS: TWO PORMS OF IGF-1, IGF-IA AND IGF-IB ARE
PRODUCED BY ALTERNATIVE SPLICING.
-!- SIMILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                INSULIN-LIKE GROWTH FACTOR IA.
